# Energy Monitoring Solutions

With electricity prices continuing to rise it is becoming even more critical to ensure your business is making optimal use of its electricity.

The very first step to understanding and managing your energy use is to identify exactly where, when & how efficiently it is being used.

AdtechEco provides a monitoring service that will create an energy use profile that will identify areas for savings.

Our data logger will capture critical patterns of voltage, current, power, power factor, harmonics and load demand profiles.

After obtaining the energy profile we customise a detailed report with all of the key information you need in order to consider what energy efficient options are best for you.

From our monitoring, immediate cost savings can be identified and implemented in the following areas:

- **Demand Management**
- **Power Factor Correction**
- **Voltage Optimisation**
- **Load Balancing**
- **Load Scheduling**

Additional advantages of our energy monitoring solutions include:

- **Identifying usage patterns to optimise a solar power system**
- **Quantifying energy consumption before and after energy efficient modifications to verify savings and access rebates.**

**Before you do ANYTHING**  **MONITOR  
MEASURE  
IDENTIFY**
