

# Cornice Installation Guide

## Tools Required

Small Angle Grinder  
1mm aluminium grinding disc  
Scriber  
Tin Snips  
Clamp  
Beeswax or candle for lubricating disc

**CAUTION SHOULD BE USED  
AT ALL TIMES AS METAL  
EDGES ARE VERY SHARP.**

## Installation

1. Begin with the Cornice Mounting strip. Glue and fix into place along a level line, marked at correct height for your cornice. Lip is to face out.

2. Slip Cornice into the Mounting Strip.

3. Affix the top flat cornice edge into your ceiling with nails, tacks etc.
4. Sheeting goes over the top edge and butts up ready to fix in place. Sheeting can start from the centre of the room or the cornice edge.

NOTE: There is no need to remove old Cornices unless the old is larger than the new. In some cases, that a batten will be needed to be fitted. Place batten correct width from the wall directly onto the ceiling, so the back of the cornice sits against it. This is to push cornice against to prevent any distortion.

## Mitring Cornices

1. Scribe at 45° in nominated position, holding scriber flat to end plate.

2. Clamp to hold in place prior to cutting, cut to the outer side of line.

3. De-burr any sharp edges.

4. Left hand Cornice piece remains "square", to be installed as is. Right hand cornice has been mitred and scribed to fit profile of the left piece.

5. Bring Cornices together, as they will be when installed. Minor trimming may be required to perfect the join.

6. Finished Mitred cornice in place.

7. Install the next length of Cornice into the Mounting Strip, overlapping the previous Cornice. Paintable No-more Gaps may be smoothed over the joins to help them appear seamless.
