

Specialist Radioactive Iodine service for your hyperthyroid cat

Hyperthyroidism is a common disease of older cats caused by a typically benign cancer in the thyroid gland that produces excess thyroid hormone.

Radioactive iodine treatment is simple, safe and effective and avoids the difficulties of life long medications.

A single capsule of radioactive iodine destroys abnormal thyroid tissue. Cats must be kept in strict isolation for 5-7 days and then remain indoors for a further 2 weeks. Life can then return to normal! All cats receiving radioactive iodine treatment at CSS are overseen by a feline specialist. Our suites have been purpose built with older cats in mind. Every cat has direct sunlight, multiple sleeping areas, ramps toys and cat TV! It really is a lovely place for them to stay.

Please visit our website for information on radioactive iodine treatment for your cat.
