

VSS has been performing arthroscopy for many years with excellent outcomes. Arthroscopy is where we look inside the joint with a small camera. It is a minimally invasive procedure and therefore pets can recover from the surgery very quickly.

Common arthroscopic procedures are;

- in conjunction with **cruciate ligament stabilisation surgery**, to examine the joint and treat any damage to the meniscus cartilage (C-shaped cartilages inside the knee joint).
- to remove osteochondrosis lesions (**OCD**) lesions and debride the underlying bone
- to remove elbow coronoid fragments associated with **elbow dysplasia**.

Common joints arthroscopically explored are the stifle (knee), shoulder and elbow.
