

## Sara

Sara had a long history of advanced periodontal disease that didn't respond to specialist treatment. Her teeth were very mobile and couldn't be saved. She didn't want full dentures so she opted for "all on four" implant retained prosthesis. The extraction and implant placement was done under IV sedation. While the total treatment time can be several months, Sara is very please with this permanent, long term result and she can now eat without the fear of a tooth falling out.
